

# TIS-100 Ativador Download [hack]

The screenshot displays the TIS-100 game interface. On the left, there are menu options: "UNTITLED PROGRAM NOT YET SOLVED", "CREATE NEW PROGRAM", "OPEN SAVE DIRECTORY", "CYCLE COUNT STATISTICS", "NODE COUNT STATISTICS", and "INSTRUCTION COUNT STATISTICS". Each option has a corresponding bar chart. The main area is a grid of code segments, each with a title like "REPAIR 1 MORE" and a block of assembly code. The code is in a cryptic, base-26 alphabet. At the bottom, a banner reads "INCLUDES MORE THAN 20 PUZZLES AND 3 SANDBOXES".

## About This Game

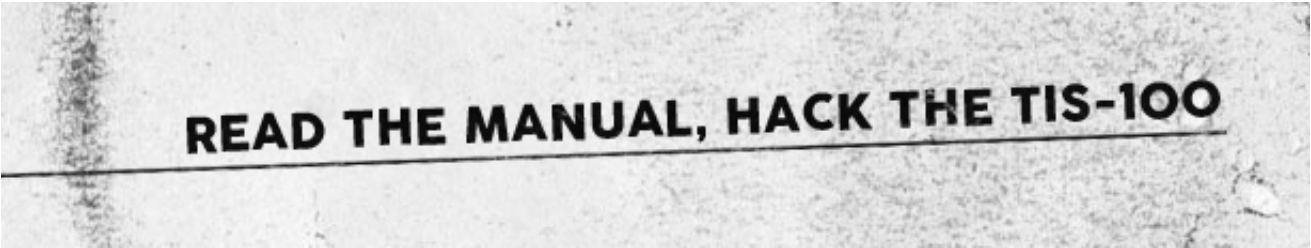

TIS-100 is an open-ended programming game by Zachtronics, the creators of SpaceChem and Infinifactory, in which you rewrite corrupted code segments to repair the TIS-100 and unlock its secrets. It's the assembly language programming game you never asked for!

---

## INTRODUCING THE TIS-100

The Tessellated Intelligence Systems TIS-100 is a massively parallel computer architecture comprised of non-uniformly interconnected heterogeneous nodes. The TIS-100 is ideal for applications requiring complex data stream processing, such as automated financial trading, bulk data collection, and civilian behavioral analysis.

## READ THE MANUAL, HACK THE TIS-100

Despite its appearances, TIS-100 is a game!

- Print and explore the TIS-100 reference manual, which details the inner-workings of the TIS-100 while evoking the aesthetics of a 1980's computer manual!
- Solve more than 45 puzzles, competing against your friends and the world to minimize your cycle, instruction, and node counts.
- Design your own challenges in the TIS-100's 3 sandboxes, including a "visual console" that lets you create your own games within the game!
- Uncover the mysteries of the TIS-100... who created it, and for what purpose?

## NODE TYPE T21 - BASIC EXECUTION NODE

### 1. Architecture

The Basic Execution Node is responsible for coordinating the behavior of the Tessellated Intelligence System. Processing can occur within the Basic Execution Node, or can be delegated to specialized processing and storage nodes.

The Basic Execution Node executes a program specified in the Basic Execution Node Instruction Set. A Basic Execution Node program specifies computational and communication operations to perform. Operations are performed sequentially, beginning with the first instruction in the program. After executing the last instruction of the program, execution automatically continues to the first instruction. This behavior supports the common usage of Basic Execution Nodes, in which programs are written to operate in a continuous loop.

In addition to the communication ports common to all Tessellated Intelligence System nodes, the Basic Execution Node contains a number of registers that are used in the execution of its program. No additional memory is available on the Basic Execution Node; if additional storage is required, the node should coordinate with another Basic Execution Node or a storage node.

All registers store integer values between -999 and 999 (inclusive). The representation of register values is implementation-defined, and knowledge of the representation is not required to program the Basic Execution Node.

#### 1-1. ACC

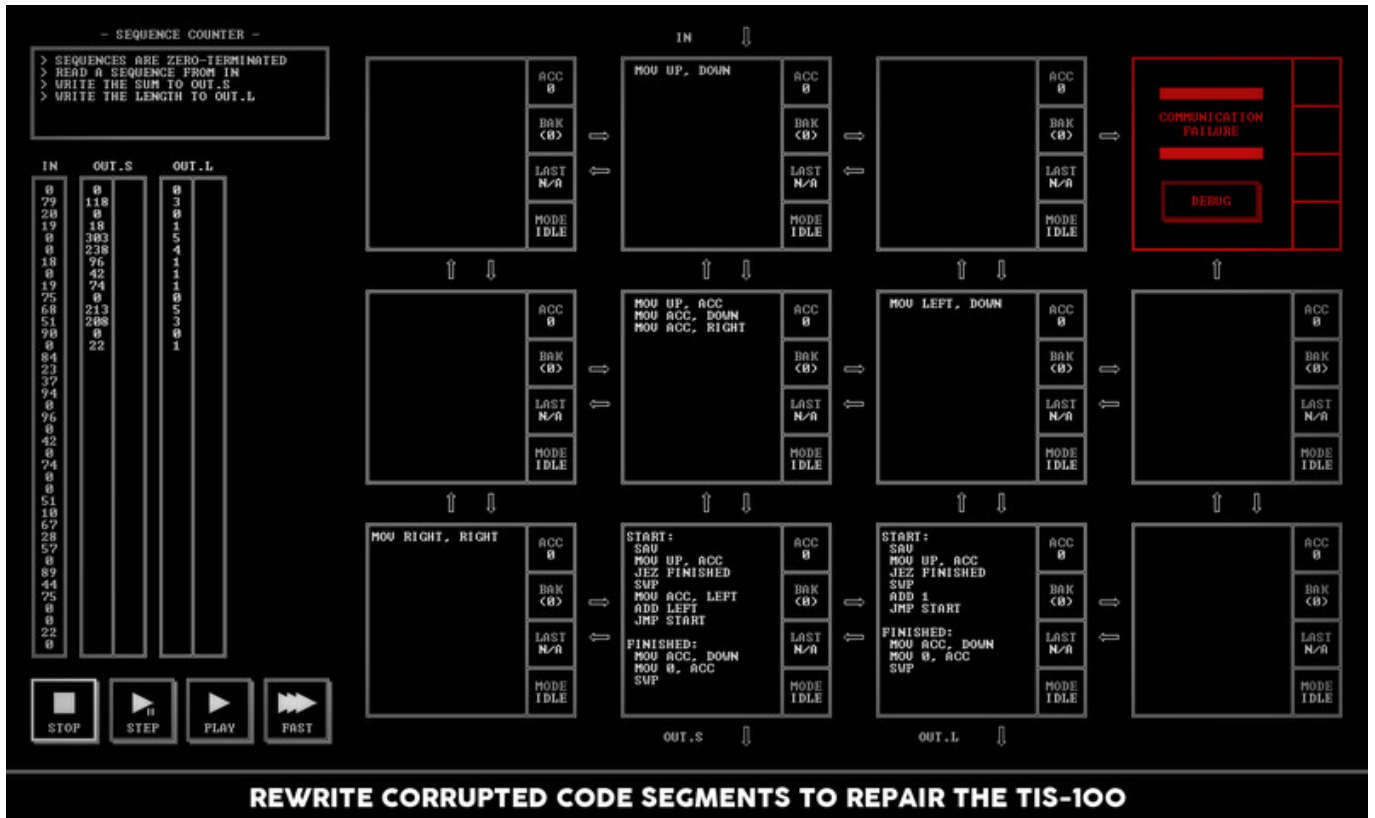

Type: Internal

Description: ACC is the primary storage register for a Basic Execution Node. ACC is used as the implicit source or destination operand of many instructions, including arithmetic and conditional instructions.
